EUROPROGETTI, TAKING CARE OF THE ENVIRONMENT

Environmental and territorial protection leads to economic development and improves the quality of life.

Since 1997, Europrogetti has worked together with government entities and companies to create the conditions for a healthy environment where we can bring up our children, work and produce more, create wealth and contribute to the development of our country. We handle large and small projects in Italy and abroad with a multidisciplinary team constantly updated on the development of standards and technologies.

We give advice and assistance in the management and optimization of water resources in the problems of waste and remediation of contaminated sites in the new frontiers of clean energy, and, in general, the prevention of pollution in the perspective of practical and effective sustainability. We offer advice and support to our customers, from concepts to completion, through the analysis of the existing phases of execution and monitoring of impacts.

The passion for our work stems from the awareness that environment and development need to grow together. For this, as always, we are committed to evaluate the weight that the development has on the environment.

iso 9001:2008 and 14001:2004 certifications allow us to act with rigor and with full awareness of the challenges we face every day.

Europrogetti, taking care of the environment.

WATER PROJECTS

Water is the source of human life and well-being. Preserving it is both a duty and a necessity. Water is, from the beginning of our business venture, the heart of our business. Being aware that it is one of the most important resources to protect, preserving and using it in a way that is sustainable is rational.

Europrogetti is involved in projects regarding using water for drinking, agricultural and industrial purposes and governs the whole integrated water cycle. From initial planning work involved for the collection of surface water and groundwater, to the sizing of distribution networks and networks of expulsion and exhaust, to the planning work of sewage treatment plants and reuse. Integrated and efficient solutions, considered with special attention to saving and the recovery of the water resource, consequently saving energy.

We realize states of consistency and due diligence (measurement campaigns of existing networks wells, infrastructure), checks and controls of operation (pressure, flow rate etc..) with our own equipment and means.

WASTE PROJECTS

A good waste management and solving past mistakes represents a serious hypothesis of our future, on the quality of our territories and on our health.

Europe produces about two billion tons of waste every year. For years we have considered this waste as a resource and we are committed in all areas of recovery: from planning separate collection systems to recycling and development.

Europrogetti supports public and Private companies, providing operational advice, know-how, and assistance for the exploitation of waste and, only as a last resort, for controlled and safe disposal.

Remediation of contaminated sites is now a need that has kept us involved with construction throughout the peninsula to re-establish and reuse the sites thereby permitting new life. As part of the remediation of contaminated sites its own customers support in ensuring due environmental diligence, in preparation and execution of plans of categorization, risk assessment and operating projects remediation. The process of reclamation is followed also in the operational phase with the site supervision and assistance on site.

RENEWABLE ENERGY PROJECTS

Energy is the engine of technological and social progress, in search of a necessary balance between sustainable development and environment impacts, we strongly believe that most businesses in Italy have large spaces for improvement and rationalization of its work. Europrogetti provides analysis and management of energy problems through consulting and setting efficient interventions, savings and use of renewable energy sources. We establish mini and micro hydroelectricity plants, a result of a long experience gained in the field of water resources, and energy production plants from biomass, because every waste can become a resource.

We have developed over the years interventions in photovoltaic sector on buildings and on the ground, for private individuals and investors. Projects addressed to the real needs of the customer, who integrate into the territory, supported by detailed economic analysis and developed with consolidated solutions with innovative technologies, because the future energy is invented every day. We guarantee assistance to all technical and administrative issues and problems, on tariffs and incentives.

SUSTAINABILITY PROJECTS

Sustainability is to allow everyone to be realized fully, preserving resources and the environment.

Europrogetti acts in support of the private and public management activities and of all environmental problems: from studies of environmental impact of new entrepreneurial initiatives or revamping of existing infrastructure, to assistance in the management and monitoring of environmental education in the context of integrated environmental authorization.

We support companies in implementing environmental management systems, in environmental responsibility control and technical and legal assistance. We ensure due diligence to verify environmental liabilities.

We have internal environmental auditors, energy certifiers, professionals who can handle all major environmental issues. We carry out monitoring campaigns and control over vast areas and across multiple environmental matrices (soil, subsoil, air, noise, fauna, flora and ecosystems) with equipment and our own means.
